## summary

I am a senior scientist at the Centre for Biomedical Imaging (CIBM), with the main affiliation with the Signal Processing Lab (LTS5) of the Swiss Federal Institute of Technology (EPFL), Lausanne, Switzerland. I am also affiliated with the Lausanne University Hospital (CHUV), Department of Radiology. At the CIBM and EPFL-LTS5, I am the machine learning leader for the imaging group at LTS5. I am in charge of conducting, coordinating the research in the lab, and supervising six Ph.D. students and two Master's students. I am also in charge of the EPFL computer vision reading group's weekly meetings, scheduling, and hosting guest speakers. I have been leading the EPFL team for the European Union's Horizon 2020 research and innovation program (ADAS&ME) for three years (2017-2020) in the field of Advanced Driver Assistance Services. At the time of writing, I have more than 2100 citations to my credit from researchers worldwide. My previous role as a postdoctoral Researcher at IBM has led to the development of novel deep learning-based medical image analysis methods leading to peer-reviewed scientific articles and patents.

Throughout my career at EPFL and IBM, I have had the opportunity to mentor and advise several talented students at Ph.D., Master's, and undergraduate levels. I have taught a number of master's courses at EPFL. My articles have been published in highly reputed conferences (CVPR, ICCV, MICCAI, etc.) and IEEE journals. I have also been a peer reviewer and program committee for several conferences, workshops, journals, and transactions published in IEEE and Elsevier.

## expertise and area of interests

- **Machine Learning** (self-supervised learning, domain adaptation/generalization, generative adversarial networks, out-of-distribution (OoD) detection, meta-learning)
- **Computer Vision** (object tracking, multi-target tracking, action recognition, event detection, image super-resolution, 3D vision, depth and ego-motion estimation)
- **Medical Image Analysis** (interpretability of deep learning, anomaly detection, semantic segmentation, disease classification, predictive models, survival analysis)
- **Affective Computing** (video-based, real-time facial expression recognition)
- **Natural Language Processing** (transformers)

My research interests lie in the general area of machine learning, medical image analysis, and computer vision particularly in deep representation learning, as well as their applications in **domain adaptation** and **self-supervised learning**, which I consider as major avenues for innovation and impact in many downstream vision-based tasks.

My research's ultimate goal is to develop robust deep image representations that capture and understand the world, as well as our human eye and mind, do. Those representations will form the basic building block of downstream image analysis tasks. Another crucial aspect of my research is to assess the performances of deep learning models on large-scale real-world datasets and improve their transparency in decision-making processes.

## academic qualifications

since Jan 2019 **Senior Scientist** The Centre for Biomedical Imaging (CIBM), with main affiliations with the Signal Processing Lab (LTS5) of the École polytechnique fédérale de Lausanne (EPFL) and the Lausanne University Hospital (CHUV), Department of Radiology

since Oct 2017 **Scientist** EPFL, LTS5

Project Title: ADAS&ME

2012–2016 **Ph.D. in Information Science and Engineering** University of Canberra, Faculty of Education, Science, Technology & Mathematics (ESTeM)

Thesis Title: Vision-based Tracking for Sports Performance Analysis

2008–2011 **M.Sc. in Electrical Engineering-Electronics** Iran University of Science and Technology (IUST), Faculty of Electrical Engineering

Thesis Title: Improved PCA Feature Extraction for Face Recognition

2004–2008 **B.Sc. in Electrical Engineering-Electronics** University of Mazandaran

Specialized Project: Licence Plate Recognition Using Feed-forward Neural Network

## work experience & professional activities

April 2016– Oct 2017 **IBM Research - Australia, Melbourne** Postdoctoral Fellow

*Skin cancer project*

*Schizophrenia project (face expression analysis)*

*Supervised PhD students*

2012–2015 **University of Canberra, Faculty of ESTeM** Guest Lecturer

*PhD research project and consulting projects*

*Guest lecturer in Computer Vision and Image Analysis*

2014–2016 **University of Canberra, Faculty of ESTeM** Research Assistant

*Terrain Park Project (Visual Tracking of Skiers)*

## skills

deep learning libraries:

- PyTorch
- Tensorflow
- Caffe
- Theano
- Keras

additional softwares:

- IBM CPLEX
- Eclipse
- SQL
- Latex
- Microsoft Office
- Adobe Photoshop

## teaching experience

2019–present	<b>EPFL École polytechnique fédérale de Lausanne</b> <i>Image Analysis and Pattern Recognition</i> <i>Flipped teaching, teaching in large class (&gt; 100 students)</i>	Lecturer
2019–present	<b>EPFL École polytechnique fédérale de Lausanne</b> <i>Lab in signal and image processing</i>	Lecturer
2018	<b>EPFL École polytechnique fédérale de Lausanne</b> <i>Lab in signal and image processing</i>	Head TA, lab coordinator
2013–2015	<b>University of Canberra, Faculty of ESTeM</b> Technology (IIT) <i>Shared responsibilities for exams/homework assignments and grades</i> <i>Lab demonstrator-preparation for tutorials and computer laboratory class</i>	TA - Introduction to Information

I have given lectures at EPFL, invited talks at multiple universities and summits, and mentored students ranging from undergraduates to PhDs. My teaching philosophy centers around the idea of **engagement** and **simplicity**. To keep students inspired, I try to provide a wider context for the material, pointing out a problem that is currently unsolved or explaining how these ideas relate to real-world applications. I usually try to accomplish simplicity by focusing my lectures on simple examples that illustrate the core ideas and to teach general strategies to break difficult problems into more tractable subproblems. I have given lectures as a lecturer at EPFL; I am teaching, together with Prof. Thiran, two courses at the master level:

**Image analysis and pattern recognition (EE-451-4 ECTS- Bozorgtabar & Thiran):**

This course explores the basic digital image analysis methods and pattern recognition: pre-processing, image segmentation, shape representation, and classification. These concepts are illustrated by applications in computer vision and medical image analysis.

**Lab in signal and image processing (EE-490(f)-4 ECTS- Bozorgtabar & Thiran):**

This course and lab sessions are designed as a practical companion to the course "Image Analysis and Pattern Recognition." The main objective is to learn how to use some critical image processing libraries, namely OpenCV, for performing image analysis tasks such as object detection and object tracking.

## media coverage

1. ABC TV Catalyst Program research on developing a diagnostic aid for depression
2. IBM's Watson Supercomputer in Early Detection of Melanoma

## projects

- since 2021 **Domain Generalization: Generalizing to Unseen Domains & Concepts** EPFL  
This project aims to improve the generalization ability of deep learning models, as usually, training data cannot capture the infinite variability of the real world. While deep learning demonstrates its strong capability in an experimental environment to handle independent and identically distributed (i.i.d) data, it often suffers from out-of-distribution (OoD) generalization, where the test data come from unseen visual domains with different distributions, w.r.t. the training one. Thus, this project aims to design deep neural architectures and learn a model that can generalize to new unseen visual domains and recognize novel semantic concepts. The rationale behind the proposed methodology is learning domain-invariant representation for visual domains applicable to various computer vision tasks, including object recognition and semantic segmentation.
- since 2019 **Tissue Type Classification in Colorectal Cancer** EPFL, CIBM  
The availability of labeled data conditions supervised learning for tissue classification. Using open-source data for pre-training or using domain adaptation can be a way to overcome this issue. However, pre-trained deep networks often fail to generalize to new test domains that are not distributed identically to the training data due to variations in tissue stainings, types, and textures. Additionally, current domain adaptation methods mainly rely on a fully-labeled source dataset. This project aims to develop a self-supervised learning-based methodology for domain adaptation to remove a fully-labeled source dataset burden.
- since 2019 **Anomaly Detection for X-Ray Images** EPFL, CIBM  
Anomaly detection (AD) methods find extensive use in radiology related fields. The recent advances in deep learning have shaken up this area of research. However, the success of such supervised systems hinges on a large amount of annotations by radiologists, which is often prohibitively very time consuming and expensive to acquire. Moreover, these supervised systems are tailored to closed set scenarios, e.g., trained models suffer from overfitting to previously seen rare anomalies at training. A promising approach to AD relies on a fully unsupervised or self-supervised training scheme. This project aims to develop a computer-aided diagnosis (CAD) system that can automatically identify abnormal X-rays by learning only from normal ones during the training phase.
- 2019-2020 **Predicting Risk Stratification for Colorectal Cancer Patients** EPFL, CIBM  
Computational pathology aims to diagnose cancer and distinguish tissue components (e.g., nuclei, tumour), which has seen great improvements in recent years due to the advancement of convolutional neural networks (CNN) based diagnosis systems. However, most of the tumor microenvironments used to describe patterns of aggressive tumor behavior are ignored. This project aims to develop a computer-aided diagnosis (CAD) system to identify histopathological patterns within cancerous tissue regions that can be used to improve prognostic stratification for colorectal cancer.

- 2017-2019 **ADAS&ME Project** EPFL  
 Advanced Driver-Assistance Systems (ADAS) are one of the fastest-growing safety applications in the automotive industry. This project's objective was to incorporate driver state, situational context, and adaptive interaction to automatically transfer control between vehicle and driver and thus ensure safety and comfort in driving for all vehicle types. Among ADAS solutions, the most demanding examples are related to monitoring systems, where the driver-centric behavior and its related analysis such as automatic face and gesture analysis are the focus of interest. Here, the goal was to leverage and analyze facial data to better understand the car driver's user experience and avoid potentially unsafe maneuvers by alerting drivers. I have been actively involved in this Horizon 2020 project (ADAS&ME Project) and supervised the EPFL team for the ADAS&ME project.
- 2016-2017 **Skin Cancer Detection Project** IBM, Australia  
 Melanoma is the most aggressive type of skin cancer, which causes a majority of skin cancer deaths. The aim of this project was to design a platform for automatic analysis of dermoscopic images, which can assist dermatologists in clinical decision making. To perform automatic analysis of dermoscopic images, segmentation of skin lesions from surrounding normal regions is usually the first step. I proposed several deep models for skin lesion segmentation, which achieved state-of-the-art results on many skin datasets.
- 2016-2017 **Retinal Image Analysis** IBM, Australia  
 I have developed a novel image super-resolution, which can reconstruct detailed images from unbelievably small, blurry images to help an accurate localization of pathologies in retinal images and has impact in the commercial space.
- 2016 **Schizophrenia Project** IBM, Australia  
 I was involved in the face analysis project and had the opportunity to mentor and advise a PhD student. This project was aimed to estimate the emotional state through analysis of facial expressions for the patients with schizophrenia.
- 2015 **Terrain Park Project:** University of Canberra, Australia  
 I have developed an accurate visual tracking system for position tracking of skiers to estimate different jump patterns of the skiers.
- 2015 **SportCipher:** University of Canberra, Australia  
 Developed in collaboration with coaches and sports performance analysts from a range of team sports such as soccer, rugby, hockey, a project in team sports performance analysis has been conducted to provide a scalable, affordable solution to assist coaches in close-to-real-time analysis of dynamic match situations, post-match analysis, and the prediction of injury likelihoods. The research outcome of this project led to successful application for research grant DTF.2.0 (Discovery Translation Fund 2.0).

## organization of scientific meetings

- 2020- Organizer of the Computer Vision Reading Group, Ecole Polytechnique Fédérale de Lausanne (EPFL), Lausanne, Switzerland
- 2019 FG 2019 Workshop Organizer on Face Analysis for Advanced Driver Assistance Systems (FA4ADAS)
- 2019 Member of the associated editors of the Frontiers in Medicine, Research Topic on Computational Pathology, Switzerland

- 2018- Machine Learning Leader for Medical Imaging Group, Ecole Polytechnique Fédérale de Lausanne (EPFL), Lausanne, Switzerland

## honors, awards and leadership

- 2017-2019 ADAS&ME Project Leadership (Horizon 2020), EPFL
- 2017 IBM Research Division Image Award
- 2017 IBM First Patent Award
- 2014 Imagine Cup, Australian Finals, Microsoft, Sydney, Australia
- 2012 International Postgraduate Research Scholarship (IPRS), Australia
- 2008 National Scholarship for Master's Degree
- 2002 Placed Third in Advanced Science Contest in Province, Placed First in the City.

## invited speaker

- 2020 Invited Speaker: Huawei France Future Image Signal Processing Workshop, Nice, France
- 2016 Invited Speaker: The Emerging Sensing Technologies Summit 2016 (ESTS'16), Melbourne, Australia

## grants

- 2018-present PHRT Grant (co-PI and main author)
- 2018-present Swiss Cancer Foundation Grant (co-PI and main author)
- 2015 Discovery Translation Fund (DTF 2.0) (co-PI and main author)

External funding is important to conduct research and support graduate students. During my career at EPFL, I have been actively involved in writing grants. I got major grants, including the PHRT grant (three years of Ph.D. support) and the Swiss Cancer Research funded. I was involved in writing application proposals and collaboration with the institute of pathology in Bern.

## membership

IEEE 2012-present

## invited peer-reviews

I am a peer reviewer of:

- 2020-present International Conference on Computer Vision (ICCV)
- 2019-present International Conference on Computer Vision and Pattern Recognition (CVPR)
- 2019-present International Conference on Medical Image Computing and Computer Assisted Intervention (MICCAI)
- 2019-present IEEE Transactions on Medical Imaging (TMI)
- 2016-present IEEE Transactions on Image Processing (TIP)

- 2017-present Journal of Computer Vision and Image Understanding (Elsevier)
- 2016-present IEEE Transactions on Cybernetics
- 2016-present The Journal of the Pattern Recognition

## publications

### Conferences
